IV.	THE EFFECTS OF MARKET STRUCTURE AND CONCENTRATION ON GASOLINE PRICES	95
	A. General Characteristics of Concentrated Markets	95
	B. Concentration in the Oil Refining and Gasoline Marketing Industry	102
	1. The West Coast	104
	a) California	104
	i. The refining industry in California is an oligopoly.	106
	ii. In the early to mid-1990s, the California market for gasoline was generally “long,” meaning there was an excess of supply over demand. Refiners also were concerned about the potential for an oversupply of CARB gasoline in 1996 and beyond. During this period, refiners in California sought to limit supply by discouraging imports, exporting gasoline, eliminating the oxygenate mandate, and preventing a refinery from operating.	111
	iii. In recent years, the California market has become “short,” meaning	

imports are needed to satisfy demand. This market tightness is optimal from a refiner's perspective for maximizing profits.	120
iv. In recent years, retail gasoline prices, gasoline price volatility, and gasoline refining margins in California have increased. The high degree of concentration has led to higher retail prices. Today California is one of the most profitable markets for refiners.	125
v. The high degree of vertical integration in California between refiners and marketers leads to higher wholesale prices.	128
vi. The high degree of vertical integration in California between refiners and marketers leads to higher retail prices.	131
vii. The high degree of vertical integration in California makes it more difficult to import gasoline into the state.	135
b) Other West Coast Markets	139
2. The Midwest	142
a) Spring Price Spike, 2000	145
b) Spring Price Spike, 2001	151
c) The Labor Day Price Spike, 2001	155
d) Spring Price Increases to Date, 2002	165
e) Company Documents	167
f) The Wolverine Pipeline Case	169
g) Upcoming Pipeline Expansions	189
V. HOW GASOLINE PRICES ARE SET	283
A. The Crude Oil Market	284
1. Crude Oil Contract Purchases	285
2. The Crude Oil Spot Market	286
3. The Crude Oil Futures Market	288
B. The Gasoline Wholesale Market	291
1. Most wholesale gasoline is sold by contract.	292
2. Exchange agreements are used to transfer gasoline between refining companies.	292
3. The spot market reflects current market conditions.	293
4. The futures market provides critical price information for both the contract and spot markets.	294
5. Rack price.	296
6. Gasoline spot prices do not necessarily reflect crude oil prices, but they are reflected almost immediately in rack and retail prices.	299
7. Dealer Tank Wagon (DTW) price.	300
8. Rebates and discounts given to branded outlets may help them compete with low priced retailers.	302
C. The Retail Gasoline Market	303
1. How retail prices are set.	303
2. Retail price trends vary by region with the Midwest experiencing a high degree of price volatility.	313
3. Zone pricing.	316

4. How retail prices are changed.	321
5. Midwestern retail gas prices changed quickly and often in 2001.	323
APPENDIX 1. METHODOLOGY USED FOR ANALYSIS OF WHOLESALE AND RETAIL PRICE DATA	337
